Brainstorming and Idea Prioritization

Problem discovery and selection rationale

Project: Global Fuel Prices and Taxation Trends: A Comprehensive Analysis

Study period: 2020–2026 **Primary tool:** Tableau Public **Data source:** supplied global fuel-price CSV dataset

1. Project background

Fuel prices affect household budgets, transport, agriculture, manufacturing and the cost of moving goods. Differences among countries may reflect a combination of crude-oil markets, taxation, subsidies, local supply chains and policy decisions. A comparative dashboard can make these differences easier to explore.

2. Initial ideas

- Compare average petrol, diesel and LPG prices across countries.
- Trace changes in fuel prices between 2020 and 2026.
- Compare taxation levels by region.
- Examine whether countries with different subsidy levels show different observed price patterns.
- Provide an interactive story that a non-technical viewer can follow.

3. Idea evaluation

Criterion	Reason for evaluation
Relevance	Does the view answer a practical question about fuel prices or taxation?
Data availability	Can the supplied dataset support the comparison without inventing values?
Readability	Can the result be understood from the title, axis, legend and tooltip?
Interactivity	Can filters or selections help viewers explore a question?

4. Selected direction

The project combines descriptive time-series analysis, country comparisons and regional taxation views. It does not attempt to prove that a single policy variable causes a price outcome.

5. Expected outputs

A Tableau workbook with worksheets, a dashboard and a story; a written report; a demonstration plan; and a web page that presents the published Tableau views.

Prepared as a project-documentation draft. Replace illustrative wording with verified results, actual screenshots, and the student's own decisions before submission.
