Problem Statement and Objectives

Defining the analytical problem

Project: Global Fuel Prices and Taxation Trends: A Comprehensive Analysis

Study period: 2020–2026 **Primary tool:** Tableau Public **Data source:** supplied global fuel-price CSV dataset

1. Problem statement

Fuel-price information can be difficult to compare because countries, fuel types, dates and taxation measures are often viewed separately. The project organizes the supplied multi-country dataset into consistent visual comparisons so viewers can inspect price levels and trends over time.

2. Main objective

To develop an interactive, descriptive analysis of global petrol, diesel and LPG prices and taxation trends for the 2020–2026 study period.

3. Specific objectives

- Summarize the average price of each fuel type using clearly labelled units.
- Show how petrol, diesel, LPG and Brent crude measures change over time.
- Compare taxation measures across global regions and selected countries.
- Build a top-three country comparison with an explicitly stated ranking metric.
- Communicate the analysis through a Tableau dashboard, story and supporting website.

4. Scope

The project uses the provided dataset and descriptive visual analytics. Findings are limited to the fields, time coverage and definitions present in that file.

5. Out of scope

The analysis is not a causal econometric study, a live price feed, or an official policy evaluation. No conclusion should be generalized beyond the available observations without additional evidence.

Prepared as a project-documentation draft. Replace illustrative wording with verified results, actual screenshots, and the student's own decisions before submission.
