Data Flow Diagram and User Stories

Information flow and user needs

Project: Global Fuel Prices and Taxation Trends: A Comprehensive Analysis

Study period: 2020–2026 **Primary tool:** Tableau Public **Data source:** supplied global fuel-price CSV dataset

1. Data flow description

The CSV dataset is loaded into Tableau. Fields are checked and assigned suitable data types. Worksheets summarize individual questions; the dashboard combines selected views; the story arranges views into a sequence; Tableau Public hosts the published visualization; the project website embeds or links to the published views.

2. Textual data-flow diagram

CSV dataset → data inspection and field preparation → Tableau worksheets → dashboard → story → Tableau Public publication → project website and demonstration.

3. User stories

- As a viewer, I want to compare average petrol, diesel and LPG prices so I can understand differences among fuel types.
- As a viewer, I want to inspect price movements over time so I can identify periods of change.
- As a viewer, I want to compare tax measures by region so I can see geographic variation.
- As a presenter, I want a story sequence so I can explain the analysis in a logical order.

4. Acceptance criteria

Each worksheet has a descriptive title and correct units; filters are understandable; the dashboard and story open from their published links; and reported values are checked against the underlying view.

5. Implementation note

The flow above describes the documented Tableau-based approach. Do not claim a database warehouse or automated pipeline was implemented unless it was actually built.

Prepared as a project-documentation draft. Replace illustrative wording with verified results, actual screenshots, and the student's own decisions before submission.
