Problem–Solution Fit

Why the proposed visualization fits the problem

Project: Global Fuel Prices and Taxation Trends: A Comprehensive Analysis

Study period: 2020–2026 **Primary tool:** Tableau Public **Data source:** supplied global fuel-price CSV dataset

1. Problem evidence

The project question involves comparing several fuel types, countries, regions and years. A raw spreadsheet can contain the observations but makes multi-dimensional comparison less immediate.

2. Proposed solution

A collection of purpose-specific Tableau worksheets is assembled into a dashboard and narrative story. The web page provides an accessible entry point for the project and its published views.

3. Fit matrix

Need	Design response	Validation question
Quick overview	KPI cards	Are the metric and unit clear?
Time comparison	Line charts	Are dates ordered and axes readable?
Regional comparison	Bar chart by region	Is the aggregation method stated?
Country comparison	Top-three view	Is the ranking metric explicit?
Narrative explanation	Story points and captions	Does each point add a clear insight?

4. Value proposition

The project makes descriptive patterns easier to inspect and discuss. It is a decision-support and learning artifact, not a substitute for official price statistics or a causal policy model.

5. Fit risks

Poor field definitions, ambiguous rankings, inconsistent filters or excessive visual density could weaken the fit. These should be checked during testing.

Prepared as a project-documentation draft. Replace illustrative wording with verified results, actual screenshots, and the student's own decisions before submission.
