Solution Architecture

Components and information flow

Project: Global Fuel Prices and Taxation Trends: A Comprehensive Analysis

Study period: 2020–2026 **Primary tool:** Tableau Public **Data source:** supplied global fuel-price CSV dataset

1. Architecture summary

The solution is organized into a data layer, analysis layer, presentation layer and evidence/documentation layer. Each layer has a defined role and should not be described as implemented beyond the actual project.

2. Components

Layer	Component	Responsibility
Data	CSV file	Supplies country, date, fuel-price and tax observations.
Analysis	Tableau workbook	Contains field preparation, calculations and worksheets.
Visualization	Dashboard and story	Combines views and sequences the analytical narrative.
Publication	Tableau Public	Makes the published views accessible by link.
Presentation	Static project website	Introduces the project and presents or links to published views.
Documentation	PDF report and demo materials	Records design choices, testing, findings and limitations.

3. End-to-end flow

Source CSV → Tableau connection and data checks → worksheets → dashboard → story → publication → website → demonstration and report.

4. Architecture decisions

Use the CSV as the documented source, keep descriptive analysis in Tableau, and separate the published visual layer from the explanatory website. Avoid adding unnecessary services where the project does not require them.

5. Operational considerations

Test links in a private browser session, check the published workbook after updates, keep a local copy of the source data, and document the date of the final validation.

Prepared as a project-documentation draft. Replace illustrative wording with verified results, actual screenshots, and the student's own decisions before submission.
