Data Platform and Snowflake Considerations

Optional platform note

Project: Global Fuel Prices and Taxation Trends: A Comprehensive Analysis

Study period: 2020–2026 **Primary tool:** Tableau Public **Data source:** supplied global fuel-price CSV dataset

1. Purpose

This document records how a cloud data platform could fit into the workflow if the course specifically requires Snowflake. It is not evidence that Snowflake was used in the current Tableau implementation.

2. Optional workflow

If authorized and available: load a copy of the CSV into a staging area, inspect schema and data quality, create a curated table or view, and connect Tableau to that validated source.

3. Validation checks

- Compare row counts before and after loading.
- Check numeric conversions and date parsing.
- Compare selected aggregates between the CSV and warehouse view.
- Document rejected records and transformation rules.
- Confirm credentials and access permissions are handled securely.

4. Why optional

The documented core workflow can operate directly from a CSV in Tableau. Do not claim warehouse setup, SQL transformations or cloud ingestion unless these tasks were performed.

5. Evidence to attach

If Snowflake is used, include actual screenshots of the database/schema/table, executed SQL, row-count checks and Tableau connection. Otherwise mark this component as not implemented or optional.

Prepared as a project-documentation draft. Replace illustrative wording with verified results, actual screenshots, and the student's own decisions before submission.
