Tableau Performance and Functional Testing

Validation plan for the workbook

Project: Global Fuel Prices and Taxation Trends: A Comprehensive Analysis

Study period: 2020–2026 **Primary tool:** Tableau Public **Data source:** supplied global fuel-price CSV dataset

1. Testing objective

Check that the workbook is accurate, understandable, responsive enough for demonstration, and consistent with the report.

2. Functional test cases

ID	Test	Expected result
T01	Open each worksheet	Correct title and visualization appear
T02	Check KPI aggregations	Displayed values match field and aggregation definitions
T03	Change date filter	Trend and relevant summaries respond as intended
T04	Change region/country filter	Affected views update consistently
T05	Inspect tooltip	Metric, category and unit are clear
T06	Open dashboard/story link	Published view loads without a broken link
T07	Compare report to chart	Reported values and ranking match the selected view

3. Performance checks

Test the published views on the device and network used for the demo. Watch for slow loading, excessive marks, cluttered tooltips and layout overflow.

4. Defect log

For each issue, record the test ID, steps to reproduce, expected result, actual result, severity, fix and retest outcome.

5. Reporting rule

Do not mark a test as passed until it has been executed. Attach genuine screenshots and record the actual test date.

Prepared as a project-documentation draft. Replace illustrative wording with verified results, actual screenshots, and the student's own decisions before submission.
