Demonstration of Proposed Features

Feature-by-feature walkthrough

Project: Global Fuel Prices and Taxation Trends: A Comprehensive Analysis

Study period: 2020–2026 **Primary tool:** Tableau Public **Data source:** supplied global fuel-price CSV dataset

1. Feature: summary KPIs

Explain what each average represents, the currency/unit, and the filter context. Confirm that the figures are generated from the intended field and aggregation.

2. Feature: price distributions

Describe how the distribution views show spread or concentration, rather than only a single average. Point out axis units and any relevant aggregation.

3. Feature: price movements

Use the time-series charts to compare direction and timing across petrol, diesel, LPG and Brent crude measures. Do not claim one series caused another based only on visual similarity.

4. Feature: regional taxation

Explain how the regional tax view is aggregated and whether the display uses a percentage or a formatted proportion.

5. Feature: highest-tax and top-three comparisons

State the exact metric and date/filter scope. Confirm that country ranking is based on the intended calculation, not a different field.

6. Feature: story and website

Show the story sequence and how the web page helps users access the published views.

7. Completion evidence

For each feature, capture a screenshot from the final workbook and record whether the feature was tested successfully.

Prepared as a project-documentation draft. Replace illustrative wording with verified results, actual screenshots, and the student's own decisions before submission.
