Scalability and Future Plan

Potential extensions after the current version

Project: Global Fuel Prices and Taxation Trends: A Comprehensive Analysis

Study period: 2020–2026 **Primary tool:** Tableau Public **Data source:** supplied global fuel-price CSV dataset

1. Current boundary

The current project is a descriptive Tableau analysis based on the supplied CSV. Its reliability depends on source coverage, field definitions and refresh practices.

2. Data extensions

Potential future sources include additional economic indicators, exchange-rate measures, local price series, policy dates and longer historical coverage, subject to data licensing and comparability.

3. Technical extensions

A future version could use a repeatable cleaning workflow, a documented data model, automated refreshes and a more structured testing process. A warehouse such as Snowflake is only appropriate if the project needs it and is actually implemented.

4. Analytical extensions

Possible methods include year-over-year percentage change, volatility summaries, inflation-adjusted comparisons and carefully designed statistical analysis. Each method would need clear assumptions and validation.

5. User experience

Add a glossary, downloadable definitions, better mobile layout and user feedback testing.

6. Roadmap

Stage	Potential work	Acceptance evidence
Short term	Improve captions and data dictionary	Reviewed labels and definitions
Medium term	Automate repeatable validation	Logged checks and reproducible results
Long term	Add context variables and deeper analysis	Documented sources and validated method

7. Caution

Future ideas should be labelled as proposed work, not described as features already delivered.

Prepared as a project-documentation draft. Replace illustrative wording with verified results, actual screenshots, and the student's own decisions before submission.
